

CynthAI_v2 — Cross-token probe matrix (current turn, 12×12)
Row = source token, Col = target slot attribute

Diagonal ($i=j$):
trivially high – attribute info
is directly in token_i's input.

Off-diagonal ($i \neq j$):
measures whether token_i encodes
slot_j's attribute via attention.

OWN|OPP boundary: white lines.

Cheater mode: full info, no POMDP.
Source/target: current turn only.
